

PRD-000 — PrepHub Design System

Purpose

This document defines the universal design principles, terminology, interaction patterns, and product philosophy for PrepHub. Every page, feature, and workflow in the application must follow this specification unless another PRD explicitly overrides it.

Product Vision

PrepHub is an adaptive SAT preparation platform that removes the guesswork from studying.

Students should not spend their time deciding what to study next. Instead, PrepHub continuously analyzes their performance and presents the next best questions automatically.

The platform should feel like a knowledgeable SAT tutor rather than a collection of practice tests.

Core Product Principles

1. Students should spend their time learning, not configuring.

The interface should minimize unnecessary decisions.

Whenever possible, PrepHub should recommend the next best action automatically.

2. Simplicity beats customization.

Avoid excessive filters, settings, and configuration options unless they provide clear educational value.

3. The adaptive engine should feel invisible.

Students should never need to understand how recommendations are generated.

They simply continue practicing while PrepHub handles the personalization.

4. Progress should motivate.

Analytics should encourage students rather than discourage them.

Celebrate consistency, effort, and improvement instead of comparing raw ability.

5. Every page should have one primary action.

Users should always know the most important thing to do next.

Avoid clutter and competing calls to action.

6. Desktop-first, fully responsive.

PrepHub is primarily designed for students studying on laptops and Chromebooks.

The experience must remain fully functional on tablets and phones, but desktop is the primary design target.

Navigation

The primary navigation consists of:

- Home
- Practice
- Progress
- Profile

The navigation should remain consistent across the entire application.

Product Terminology

Always use the following terms consistently.

Personalized Practice

- The student's recommended adaptive practice.

Diagnostic

- The initial assessment that builds a student's first learning profile.

Question Family

- Multiple versions of the same underlying SAT concept.

Practice Session

- One uninterrupted studying session.

Avoid exposing internal terms such as:

- Adaptive Set
- Recommendation Engine
- Plan ID

These remain implementation details.

Visual Design

The interface should feel:

- Modern
- Clean
- Minimal
- Academic
- Trustworthy

Avoid excessive animations or visual clutter.

Whitespace should be used generously.

Buttons

Every page should have one clearly dominant primary button.

Examples:

- Continue Practice
- Start Diagnostic
- Review Answers

Secondary actions should never compete visually with the primary action.

Dashboard Philosophy

The Home page exists to answer one question:

"How am I doing?"

Students do **not** answer questions directly from the dashboard.

Studying begins inside the Practice page.

Practice Philosophy

The Practice page exists to answer one question:

"What should I study next?"

Personalized Practice is the primary feature.

Custom practice options are secondary.

Progress Philosophy

The Progress page exists to answer one question:

"Am I improving?"

Visualizations should focus on growth over time rather than perfection.

Accessibility

PrepHub should:

- Support keyboard navigation.
 - Meet WCAG accessibility standards where practical.
 - Use readable typography.
 - Maintain strong color contrast.
 - Never rely solely on color to communicate important information.
-

Gamification Philosophy

PrepHub uses gamification only when it reinforces learning.

The goal is to increase consistency—not create unhealthy competition.

Locked Feature

Every partnered school has a School Community Progress section displaying aggregate engagement metrics, such as:

- Questions answered this week
- Questions answered this month
- Study hours completed
- Number of active students
- Community progress toward school-wide study goals

These statistics should be visible to students and expanded further for school administrators.

Tentative Feature

Individual student leaderboards remain under consideration.

If implemented in the future, they should reward effort and consistency rather than raw SAT performance.

Locked Product Decisions

The following decisions are considered finalized for Version 1:

- Desktop-first, fully responsive design.
 - The dashboard is informational only.
 - Students begin studying from the Practice page.
 - Diagnostic assessments contain 21 questions.
 - Personalized Practice is the primary learning experience.
 - Personalized practice is generated internally in adaptive sets of 21 questions.
 - Students never see the adaptive set size.
 - Students can leave and resume practice at any time.
 - The dashboard displays:
 - Questions answered today
 - Questions answered this week
 - Study time today
 - Study time this week
 - Progress is automatically saved.
 - PrepHub minimizes unnecessary user decisions.
 - The adaptive engine operates automatically behind the scenes.
 - Every partnered school has a School Community Progress section with aggregate engagement metrics.
 - Individual leaderboards remain a future feature pending further design.
-

Success Criteria

PrepHub should consistently feel like:

- A personal SAT coach.
- Simple enough for any student to navigate.
- Motivating without being distracting.

- Intelligent without exposing unnecessary complexity.
- Built to help students study—not manage settings.
